Abseil Access System for St Martin's Lane, London.

The problem.

The architect required an access and maintenance solution for the building facade around several lightwells. The site layout and close proximity of adjacent building precluded the use of BMU's or MEWP's for facade access and maintenance.

Unirail abseil rail system fitted to steelwork running around a lightwell.

The solution

Vertical Technology used its extensive experience of industrial roped access to devise a suitable abseil access strategy and design to achieve the client's wishes.

Unirail - an aesthetically pleasing, low profile extruded aluminium rail abseil access system that can be profiled to match the perimeter of the building.

The design of the abseil system integrated into the building fabric in an effort to ensure the highest levels of worker protection, enabling free and unhindered movement whilst remaining low profile thereby preserving the aesthetics of the structure
